WEEKS ACTIVE PER TRACK

THE INTERNSHIP ARC

- 
- 3 Ship and present** Week 6
Custom Dashboard 2.0, Spot demoed live at DevCon, and the Capstone submitted a week early.
 - 4 Deepen and automate** Weeks 7 to 8
Perpetual calc-script drivers, rolling forecasts, and local QLoRA fine-tuning for an EPM assistant.
 - 5 Productize and validate** Week 9
GL integration, HSP snapshot sync, a secure Chrome agent, hosted infrastructure, and production test coverage.

Executive summary

Over 9 documented weeks, Rohan moved quickly from onboarding into hands-on delivery across several IBM workstreams. Early on he completed 57 hours of IBM and Oracle learning across 186 modules, earned 8 badges and certifications, and finished all of his Intern10 networking interviews. He joined the DRW AMS managed services team and the MCW Oracle EPM implementation team, and began Digital Product Engineering work on Boston Dynamics Spot by labeling 898 images and standing up the computer vision pipeline that anchored his technical contribution.

Across the middle and later weeks he trained a YOLO object detection model to roughly 99.5% mAP@50, fully integrated it with Spot with movement controls and safety systems, and presented the system live at IBM DevCon before open-sourcing the trained model. On MCW he authored multiple Oracle EPM business rules, including a rolling 13-day forecast and SOFR loan logic, built a custom Dashboard 2.0 with a tabbed navigation flow, and architected an Oracle EPM AI agent platform connected to ICA. As capstone Team Lead he delivered the NEXUS project a week early and completed all Intern10 tasks five weeks early. He then stood up a local AI workstation for QLoRA fine-tuning and RAG research aimed at accelerating Oracle EPM consulting.

In the final week he productized that research as EPM Wizard: a hosted multi-user Oracle EPM workspace with GL and chart-of-accounts spreadsheet integration, HSP-aligned snapshot sync, form deployment, a secure Chrome browser agent, and redacted workbook and VBA context. He added Google OAuth, PostgreSQL owner isolation, Together AI, a read-only 12-role agent sandbox, and production web and installed-extension test environments. The final validated snapshot passed 595 backend tests, 126 frontend tests, 30 extension tests, and 16 browser end-to-end tests.

Week by week

WEEK 1

Onboarding, Self-Learning, Networking, and Initial Interviews

During Week 1, Rohan completed onboarding and went beyond the required learning by spending additional time on IBM Learn. He completed 57 hours of learning, 186 modules, and earned 5 badges/certifications. He also completed Intern10 networking interviews and met with his buddy, PM, manager, and IBM professionals including Neil Kaufman, Karla McMillan, and Summer Gerhart.

WEEK 2

Oracle Training, DRW AMS, MCW Implementation, Spot, and Capstone Leadership

During Week 2, Rohan began contributing across several workstreams. He completed Oracle training, earned 3 Oracle badges, and finished IBM self-paced training. He joined DRW AMS and MCW Implementation onboarding, completed multiple Intern10 deliverables, and began Digital Product Engineering work with Boston Dynamics Spot. He labeled 898 images for computer vision training, set up a GitHub repo, and took a leadership role in the capstone project.

WEEK 3

YOLO Model Training, DRW Shadowing, MCW Meetings, and Capstone MVP

During Week 3, Rohan made significant technical and project progress. He trained a YOLO model from the labeled Spot dataset, organized the GitHub repo, documented the dataset, and began fine-tuning/error tracking. The model achieved approximately 99.4% Precision, 99.4% Recall, and 99.5% mAP50 on the validation dataset. He also shadowed DRW meetings, presented Intern10 deliverables to PM John, joined MCW meetings, and led capstone development by creating a RAG architecture, GitHub workflow, documentation system, and MVP demo.

WEEK 4

MCW Business Rules, Spot Integration, and Capstone Leadership

During Week 4, Rohan broadened his impact across both Oracle Managed Services and Implementation. He met with his AMS mentor and PM to deepen his understanding of Oracle EPM Managed Services and ticket management. On MCW, he developed multiple Oracle EPM business rules including a rolling 13-day forecast and built the first Predictive Cash Flow report. He completed YOLO model testing at ~99% accuracy and fully integrated the model with Boston Dynamics Spot, adding movement controls, safety features, a kill-switch, a dance routine, and a gRPC connection with a multithreaded inference pipeline. He continued leading the capstone, integrating IBM Granite models, TTS/STT, and cross-model support into the Nexus platform.

WEEK 5

MCW EPM AI Agent, SOFR Business Rules, DRW Presentation, and Capstone Delivery

During Week 5, Rohan deepened his MCW Implementation work by building Predictive Cash Forecasting dashboards, developing a new Oracle EPM business rule for SOFR loan percentage logic, and architecting an Oracle EPM AI agent chat platform. He connected ICA API keys for secure data usage, extended an open-source chat platform with Skills, Bookmarks, Projects, MCP support, and file attachments, and deployed the application locally with thorough testing. On DRW AMS he delivered and revised an Oracle EPM presentation for John, researched implementation cost and timelines, and built an intern feedback form. He advanced the Boston Dynamics Spot integration, troubleshooted the gRPC connection, and improved project documentation. He also completed and submitted the final IBM Capstone presentation and video one week early.

WEEK 6

MCW EPM Dashboards & Navigation, EPM AI Desktop App, Spot at DevCon, and Capstone Submission

During Week 6, Rohan deepened his MCW Implementation work by continuing to build Predictive Cash Forecasting dashboards, creating a custom Oracle EPM Dashboard 2.0 and a tabbed Navigation Flow, and developing a new business rule for SOFR loan percentage population. He extended the Oracle EPM AI desktop application with CSV export, column sorting, and real-time search/filter, and architected an AI-powered EPM chat interface connected to ICA API keys with Skills, Bookmarks, Projects, Confidence Scoring, customizable agents, MCP integration, and file attachments before deploying and testing it locally. He presented the Boston

Dynamics Spot computer vision and ML implementation to IBM interns and at DevCon, demonstrating autonomous detection, retrieval, and a victory dance at over 70% confidence, and open-sourced the trained model for reuse. On DRW AMS he completed all Intern 10 tasks five weeks early, and he submitted the final IBM Capstone one week ahead of schedule while leading the team to delivery.

WEEK 7

Perpetual Day-of-Week Driver, Local AI Fine-Tuning, and DRW Support

During Week 7, Rohan advanced his Oracle EPM implementation engineering by designing and implementing a perpetual day-of-week driver for Daily Planning applications using custom calculation scripts, including leap year and non-leap year handling to keep dates aligned across fiscal years. He continued enhancing the Oracle EPM AI desktop application and deepened his knowledge of Planning metadata, substitution variables, and dynamic forecasting. On the technical innovation side, he configured an Intel Arc Pro B70 workstation, validated Intel GPU training, and executed local QLoRA fine-tuning on open-source coding models while researching RAG and local inference architectures for enterprise knowledge systems. He also supported DRW AMS by troubleshooting Planning forms, business rules, and forecasting issues, and met with IBM professionals to discuss technical career paths.

WEEK 8

Dynamic Rolling 13-Day Forecast, SOFR Loan Solution, and Enterprise AI Assistant

During Week 8, Rohan delivered a dynamic rolling 13-day forecast within Oracle Predictive Cash Forecasting, using substitution variables and dynamic date-range logic so forecast periods automatically align with current application settings. He validated forecasting outputs, resolved form configuration issues, and continued advancing the SOFR loan forecasting solution with interest accrual and loan balance logic while improving Planning forms, dashboards, and reporting views. He also continued building local AI infrastructure and an AI-powered Oracle EPM assistant that leverages implementation knowledge and documentation, researching scalable enterprise assistant architectures. In parallel he supported DRW AMS across client meetings and Oracle EPM support activities, and reflected on the internship to identify future growth in application development, data engineering, and AI-focused consulting.

WEEK 9

EPM Wizard Productization, GL Integration, Chrome Extension, and Production Hardening

During Week 9, Rohan transformed EPM Wizard into a production-oriented Oracle EPM platform spanning a hosted multi-user chat workspace, GL and chart-of-accounts spreadsheet integration, HSP-aligned snapshot synchronization, form deployment, and a secure Chrome browser agent. He added workbook and VBA context, Oracle-specific browser adapters, OAuth and EPM connection flows, and a real read-only multi-agent sandbox with owner-scoped lifecycle and capacity controls. He also deployed the stack with PostgreSQL, Google OAuth, Together AI, and CI/CD, while redesigning the product experience and documentation. The final validated snapshot passed 595 backend tests, 126 frontend tests, 30 extension tests, and 16 browser end-to-end tests.

Signature highlights

- Labeled 898 images to train the Boston Dynamics Spot computer vision model
- Trained a YOLO11 object detection model reaching about 99.5% mAP@50 (about 99.4% precision and recall)
- Presented the Spot computer vision system live at IBM DevCon and open-sourced the trained model
- Led the NEXUS capstone as Team Lead and submitted it one week ahead of schedule

- Completed all Intern10 deliverables five weeks ahead of schedule
- Built a custom Oracle EPM Dashboard 2.0 with a tabbed navigation flow
- Architected an Oracle EPM AI agent chat platform on ICA (Skills, Projects, MCP, file attachments)
- Delivered a dynamic rolling 13-day forecast in Oracle Predictive Cash Forecasting
- Stood up a local AI workstation and ran QLoRA fine-tuning on open-source models
- Built a GL and chart-of-accounts workflow with metadata CSV output, tenant reconciliation, and versioned context merges
- Shipped a secure Oracle-aware Chrome browser agent with workbook and VBA context as extension version 0.6.0
- Productized EPM Wizard as a hosted multi-user platform and validated it with 751 core tests plus 16 browser end-to-end tests
